## Today's Session

- 01 The Problem With Backward-Looking Controls
- 02 What Predictive Analytics Actually Means
- 03 The Inputs That Matter
- 04 Models, Forecasts & Scenario Testing
- 05 From Dashboards to Decision Support
- 06 Governance, Explainability & Audit Trails
- 07 Getting Started — Practical Next Steps

01

# The Problem With Backward-Looking Controls

*Why lagging indicators leave teams exposed*

# You're Managing Yesterday's Project

## Traditional Approach

- Valuations issued monthly — data already 4–6 weeks old
- Cost reports reflect completed work, not emerging trends
- Variations captured after the fact
- Cashflow forecasts based on programme assumptions, not actuals
- Risk flagged when it's already crystallised

## Predictive Approach

- Live progress data feeds rolling cost-to-complete models
- Constraint logs and productivity rates signal slippage early
- Change control pipeline visible before formal instruction
- Cashflow projection refreshed from real procurement signals
- Risk surfaced while there is still time to act

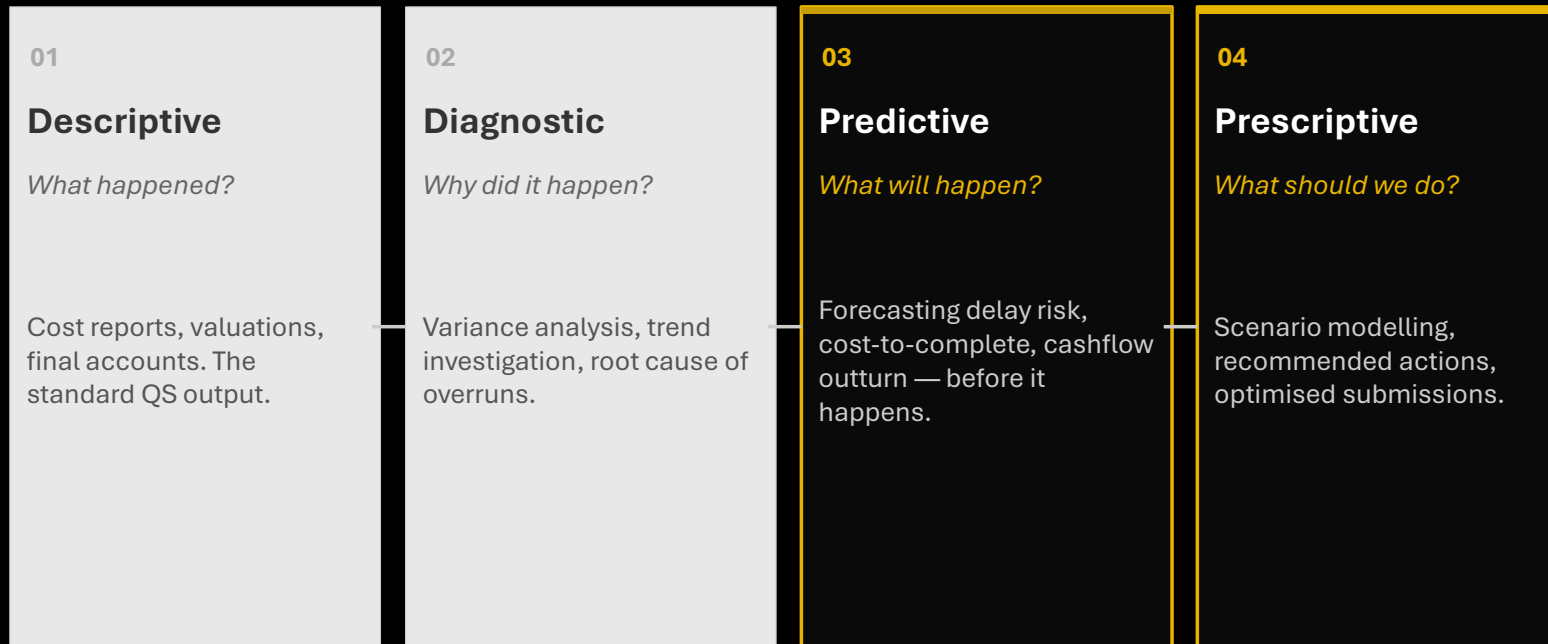

*The gap between what you report and what is actually happening is where commercial exposure lives.*

02

# What Predictive Analytics Actually Means

*In the commercial and construction context*

# Four Levels of Analytics Maturity

*Most commercial teams operate at levels 1–2. The opportunity is levels 3 and 4*

03

# The Inputs That Matter

*What data actually drives a useful forecast*

## Signal vs. Noise — The Right Inputs

### Programme & Progress

- % complete vs planned
- Earned value metrics
- Lookahead programme data

### Productivity & Labour

- Output rates vs benchmarks
- Constraint logs & delays
- Gang sizes & shift patterns

### Commercial Pipeline

- Uncommitted cost exposure
- Change control register
- Procurement status & prices

### External Signals

- Material price indices
- Weather & site conditions
- Subcontractor solvency flags

*Not all data is equal. Inputs must be timely, consistent and traceable to be forecast-ready.*

# Data Readiness — The Honest Assessment

Data Type	Availability	Quality Challenge	Forecast Usability
Programme (P6/Asta)	Usually exists	Often not updated	Medium
Progress %	Sometimes	Subjective	Low-Med
Cost commitments	Yes	Good in ERP	High
Change register	Inconsistent	Manual, patchy	Low
Labour outputs	Rarely captured	Not tracked	Low
Procurement signals	Sometimes	In buyer's head	Low
External indices	Yes (BCIS/ONS)	Good	High

*Improving data quality is the highest-leverage investment before deploying predictive models.*

04

# Models, Forecasts & Scenario Testing

*Translating data into commercial foresight*

# Practical Model Types for Construction

## Cost-to-Complete Forecasting

Blends committed costs, productivity rates, and earned value to project outturn cost. Updated from live data rather than static assumptions.

*For: QS / Cost Manager*

## Delay Risk Modelling

Monte Carlo or regression models applied to constraint logs, weather, lookahead programme and historical slippage patterns to forecast completion probability.

*For: Project / Programme Manager*

## Cashflow Projection

Refreshed from procurement commitments and progress actuals. Flags negative cashflow windows and mismatches against application cycles.

*For: QS / Commercial Director*

## Change Control Pipeline

Tracks identified, potential, and instructed variations. Flags commercial exposure and likelihood of entitlement to support stronger submissions.

*For: QS / Contract Manager*

## Subcontractor Risk Scoring

Combines financial signals, performance data and procurement status to flag at-risk supply chain before problems escalate.

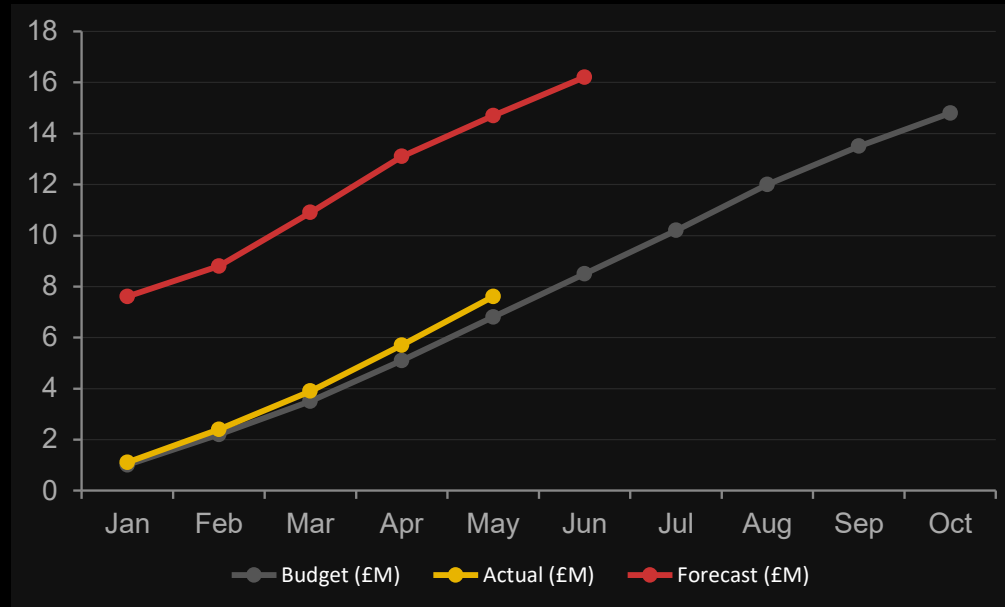

*For: Commercial / PM*

## Scenario & Sensitivity Testing

Allows teams to stress-test 'what if' scenarios — delay, inflation, scope growth — to understand commercial impact before it occurs.

*For: All Roles*

## Cost-to-Complete: What the Model Shows

Budget at Completion  
**£14.8M**  
*Original contract*

Forecast Outturn  
**£16.2M**  
*+\$1.4M exposure*

Overrun Signal  
**Month 2**  
*When model flagged risk*

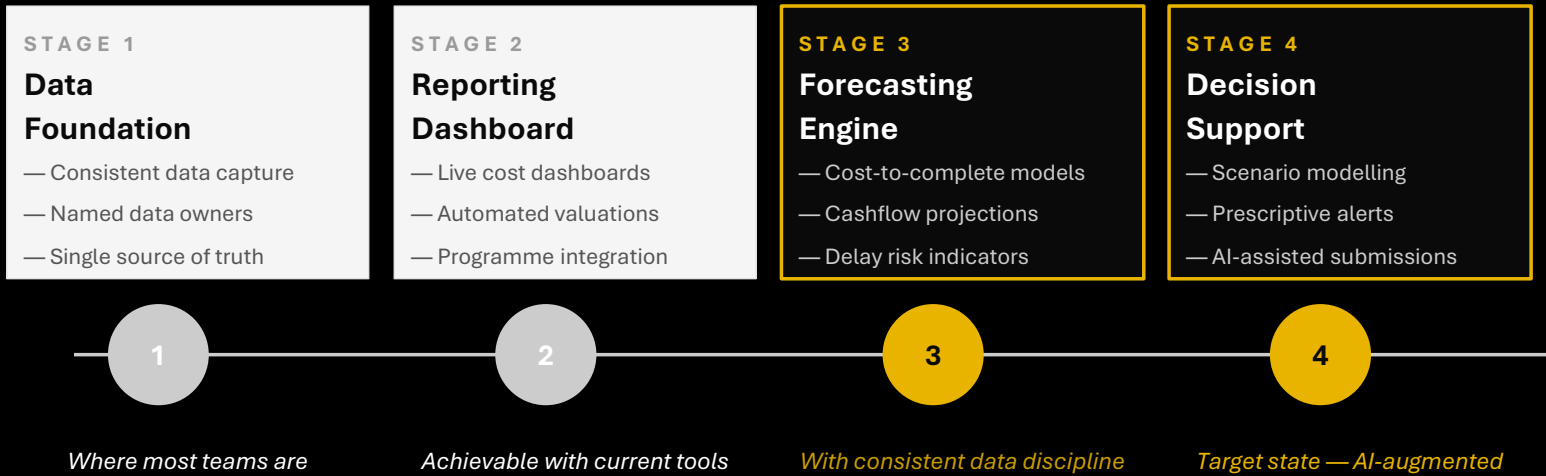

The model flagged a £1.4M exposure at Month 5 — giving 5 months to intervene before final account.

05

# From Dashboards to Decision Support

*Maturing your capability progressively*

# The Analytics Maturity Journey

**Start with Stage 1. You cannot forecast reliably from inconsistent data.**

## Where AI Supports — and Where It Doesn't

### AI / Automation Adds Value

- Processing large datasets faster than manual review
- Spotting patterns in productivity or cost data
- Generating draft cashflow scenarios from actuals
- Flagging anomalies in subcontractor invoices
- Structuring and formatting report submissions

### Human Judgement Stays Central

- Interpreting contractual entitlement and risk
- Negotiation strategy and commercial relationships
- Validation of model outputs against site reality
- Accountability for submissions to clients/funders
- Managing disputes, claims and final accounts

*AI augments the commercial professional. It does not replace judgement, accountability or expertise.*

06

# Governance, Explainability & Audit Trails

*Using predictive tools responsibly*

## Five Governance Principles for Predictive Analytics

### 01 Explainability

Every forecast must be traceable to inputs. If you cannot explain why the model output a number, you cannot defend it in a submission or dispute.

### 02 Validation Loop

Predictions must be compared to actual outcomes. Unchecked models drift. A monthly calibration review should be built into standard commercial controls.

### 03 Audit Trail

Assumptions, inputs, model versions and sign-offs must be recorded and timestamped. This is especially critical for NEC Early Warning Notices and compensation events.

### 04 Accountability

A named professional must own and sign off every forecast. AI can generate the numbers; a qualified person must stand behind them.

### 05 Avoiding Over-Reliance

Models should inform, not replace, judgment. Teams must maintain the ability to challenge outputs — and recognise when conditions fall outside model assumptions.

07

# Getting Started – Practical Next Steps

*What you can do on your next project*

## Your Predictive Analytics Action Plan

### Immediate (This Month)

- 1 Audit your data: where is it, who owns it, how current is it?
- 2 Map your change control process — identify where it breaks down
- 3 Identify one metric you wish you'd known earlier on a recent project

### Near-Term (3 Months)

- 1 Implement a single live dashboard for cost and programme
- 2 Introduce a weekly constraint log linked to cost risk
- 3 Define the forecasting outputs your client actually needs

### Developing (6–12 Months)

- 1 Build or adopt a cost-to-complete model with explainable inputs
- 2 Run first scenario test on an active project
- 3 Establish governance — named model owner, validation cycle

# Questions & Discussion

## Key Takeaways

- Predictive analytics is not magic — it requires good data, clear process and human accountability
- Start with data quality before deploying models
- Dashboards are not enough: build toward forecasting and scenario capability
- AI augments the QS and PM role — it does not replace judgment
- Governance, explainability and audit trails are non-negotiable
- Progressive maturity is the goal — not a big-bang transformation

# KOSMOS

**Digital · Cost · Carbon**

*[www.KOSMOS.company](http://www.KOSMOS.company)*

# Traditional QS vs Digital QS

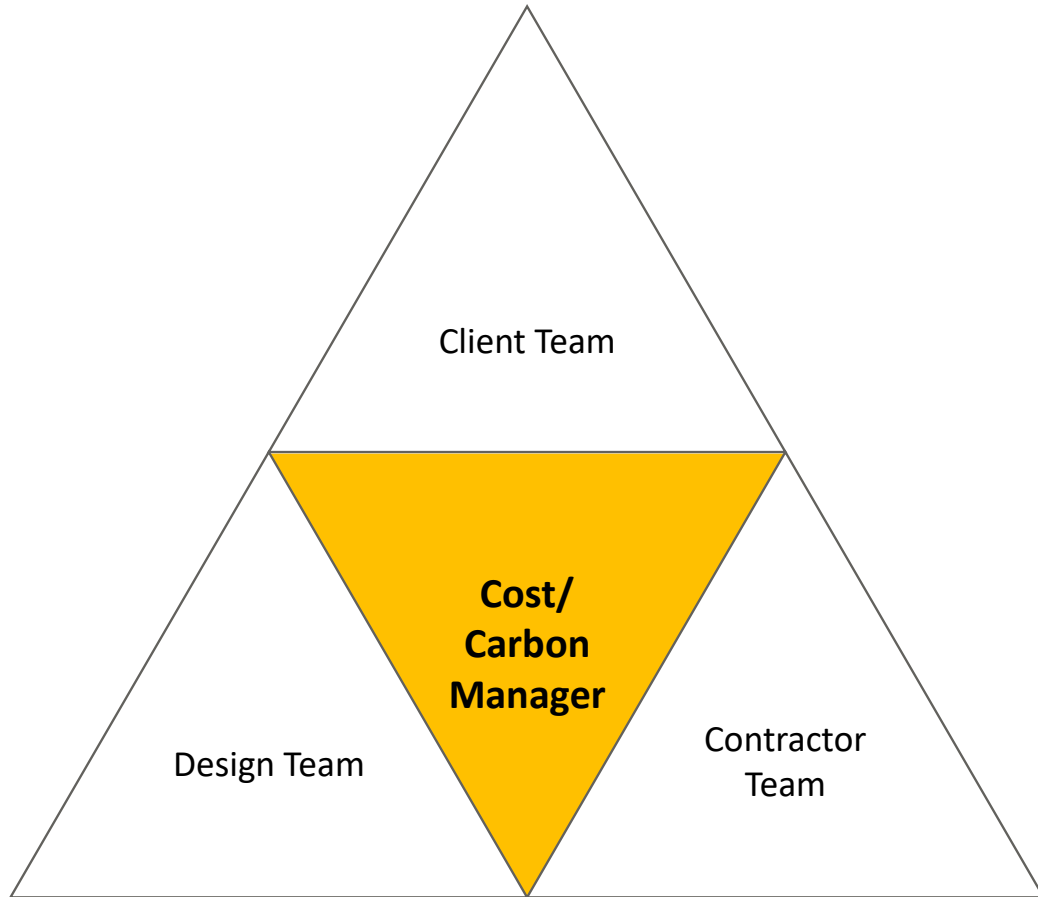

*Traditional models put the QS at the end of the process playing a reactive role*

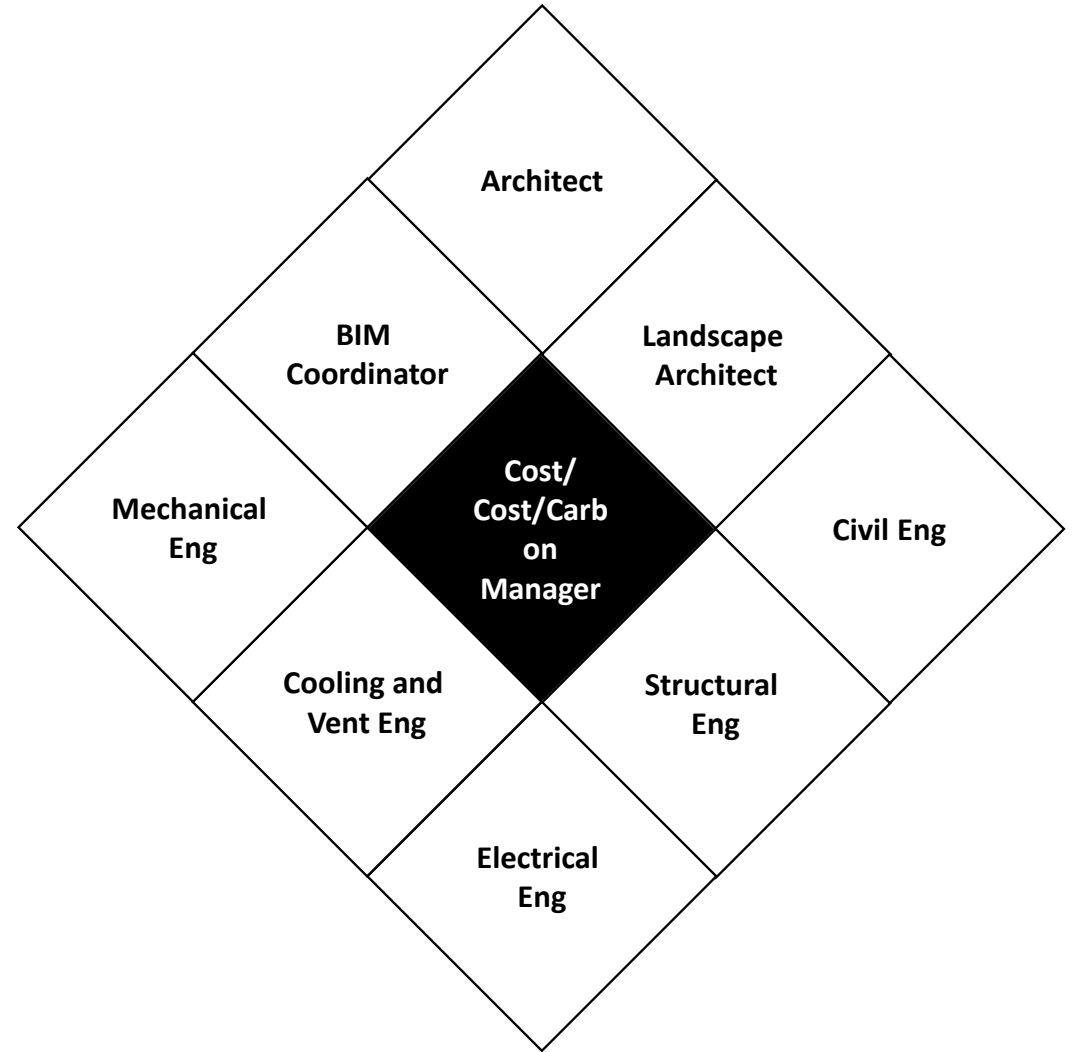

*Cost/Carbon is estimated while the design is ongoing, tracking live updates*

NBS Component Type Id	97899
NBS Date	2025-02-13 20:03:57
NBS Discipline	Gulv

## Pset Quantity Takeoff

- Code
- Category
- Type name
- System (MEP)
- Dimensions (Area, Volume, Length, etc.)

## Pset Quantity Takeoff

- Building
- Demolition/ Existing/ New Building
- Work package
- Spec. reference

All Information should be gathered in 1 Pset\_Quantity Takeoff for Cost Estimation/ BoQ

**KOSMOS**

The screenshot shows the 'INFO' panel for 'Slab.4.22' with the 'Dimensions' tab active, showing the following dimensions:

Property	Value
Area	9,433.51 m2
Elevation at Bottom	23.97 m
Elevation at Bottom Core	23.97 m
Elevation at Top	24.00 m
Perimeter	803.70 m
Thickness	27 mm
Volume	254.70 m3
